

Jassim Abdul Gafoor

Engineering professional with a UBC Integrated Engineering background and two years managing high-value industrial equipment projects (USD 50M+ portfolio). I build automation that removes manual work from manufacturing operations — Python, APIs, and data workflows — and I founded a student team that built electric motorcycles. Currently pursuing an MSc in Industrial Engineering at Curtin University, focused on machine learning and manufacturing & supply chain optimisation.

jgafoor56@gmail.com jga4.com +61 466 363 920 linkedin.com/in/jassimga4

Skills

Python, computer programming, workflow automation (APIs, data pipelines), 3D modelling (Solidworks, CAD), data visualization, graphic design

Project management: scope/budget/schedule delivery, risk management, stakeholder engagement, client relationship management

Languages: English (native), Tamil (intermediate), French (beginner)

Experience

JGA4 Consultancy — Project Manager

Sep 2025–Present, Coimbatore, India

- Providing industrial project management services and engineering professional expertise.
- Managing all business responsibilities including invoicing, sales, and tax compliance.

Food Process Solutions — Project Co-ordinator II

Jul 2023–Jul 2025, Vancouver, BC

- Managed 20+ high-value industrial equipment projects (USD 50M+), delivering on scope, budget, and schedule with a focus on client relationships.
- Implemented Python scripts using the Clockify API and ADP timesheets, optimising workflows and reducing administrative manhours by 90%.
- Collaborated with 10+ colleagues to implement a new installation safety program; developed training materials for 200+ on-site resources and ensured compliance.
- Produced technical specifications, plans, procedures, and equipment design documentation.
- Risk management, client relationship management, and stakeholder engagement across project portfolio.

Education

Curtin University — MSc Industrial Engineering

2026–2027 (in progress), Perth, WA

Relevant coursework: Machine Learning, Manufacturing and Supply Chain Optimisation

University of British Columbia — BSc Integrated Engineering (Washington Accord)

Graduated 2021, Vancouver, BC

Relevant coursework: Control Systems, Mechatronics, Engineering Design Projects

Doha College — A-Levels

Graduated 2016, Doha, Qatar

Mathematics, Further Mathematics, Physics, Chemistry, Design Technology. High school robotics; Edexcel Outstanding Achievement Award.

Certifications

Applied Data Science Program — MIT Professional Education

Jan 2023–Apr 2023

Projects

UBC ThunderBikes — Founding Member & Safety Officer

May 2018–Sep 2019

- Founded a student engineering team building electric motorcycles for the Formula Lightning competition.
- Converted standard bicycles to electric-powered prototypes; supported a high-profile electric prototype project with direct engagement from the UBC president.
- Oversaw safety protocols and tool training for 20+ members; led recruitment and interviewed 15+ candidates.

Exoskeleton Project (UBC IGEN 330)

Sep 2018–Apr 2019

- Designed and prototyped a lower-limb exoskeleton to assist children with Spinal Muscular Atrophy.
- Implemented PWM actuator control to replicate natural gait; built embedded control systems with microcontrollers and motor drivers.
- Led electrical system design within a 6-member interdisciplinary team; conducted kinematic and biomechanical analysis.

Smart Skin Body Tracking (UBC IGEN 430)

Aug 2020–Jun 2021

- Designed CAD sensor-housing modules for UWB sensor development boards; logged tracking data with Python and MATLAB.
- Developed the prototype through the UBC APSC Summer Entrepreneurship program; secured 8,000 CAD in funding at Qatar Business Incubation Center.

MEMS Gyroscope (UBC ELEC 455)

Sep 2018–Dec 2018

- Designed a 0.2mm × 0.2mm MEMS gyroscope (Solidworks); modelled electro-mechanical coupling in Simscape/Simulink before fabrication.
- Completed schematic capture (Cadence), generated SOI-MUMPS fabrication mask layouts (Clewins), and performed FEA on the silicon structure.

3-Input NAND Layout (UBC ELEC 402)

Oct 2020–Nov 2020

- Designed a 3-input NAND gate layout in Cadence Virtuoso on a 45nm CMOS node; verified with simulation, DRC, and LVS.
- Analyzed parasitic capacitance/resistance via post-layout extraction for delay and power estimation.

FPGA Simple iPod (UBC ELEC 402)

Jan 2019–Feb 2019

- Designed FPGA hardware in SystemVerilog to read from flash memory; implemented FSMs and modular, reusable code.

Phone Heater Case (UBC IGEN 230)

Sep 2017–Apr 2018

- Engineered a thermally insulated phone case extending battery life in sub-zero temperatures: microcontroller-regulated heating element with temperature sensors.
- Validated performance with thermal testing; prototyped enclosures via 3D modelling and rapid prototyping.

UBC AeroDesign — Landing Gear Sub-Team

Oct 2016–Apr 2017

- Designed and fabricated landing gear in a 4-person team; engineered a new suspension system for increased payload capacity.
- Built a custom test rig to simulate landing impacts; team placed 3rd overall at SAE Aero Design 2020.
